No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                     The present sequence encodes a protein that is specific for pathogenic strains of Neisseria. The polymuclecides, polypeptides, or their antigenic fragments, are used in vaccines to treat or protect against Neisseria infections, particularly by N. meningitidis. The polymuclecides sequence is also used for recombinant production of the polypeptide and to produce attenuated Neisseria strains that overexpress it, or express it in a non-toxic mutant form.

```

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414

represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAB25663 represent to Reseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis Menb polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could Scarlato V; Neisseria meningitidis; Neisseria gonorrheae; genome; immunogenic; antigen; vaccine; diagnosis; infection; antibacterial; identification; Meningococcus B; MenB; ds. 3121 AACGGCTTGGCACGTTACAGCTACGCCGGTTCCAAACAGTACGGCAACCACCACCAGCAGA 3180 ACGGTAACGGGCGGCGTTTACCGGCGCGCGCTGCAGCAGGCGGCACGCGAAT 3061 ATGCCGCACACCCGCCTGGTTGCCGGTCTGGCCGCGGATGTCGAATTCGGCAACGGCTGG AACGGCTTGGCACGTTACAGCTACGCCGGTTCCAAACAGTACGGCAACCACAGCGGACGA Isolated nucleotide sequences of Neisseria meningitidis which can used in the diagnosis and treatment of N. meningitidis infection other Neisserial infections, for example, N.gonorrhoea 3.5 H, Venter JC; Scarselli M, meningitidis partial DNA sequence gnm\_74 SEQ ID NO:74. ä
be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                               10830

The present invention describes the full length genome of Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 Let AAF21513 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences which overlap each other at the beginning and end of each the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated at the beginning of AAF21607, the last 49980 bp of AAF21548 is repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21588 encode the Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Masignani V;

due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which among effective in vaccines than the outer membrane proteins currently used in compositions for treating or preventing infection þę proteins can more used.

At least one domain in the protein is deleted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43808-AAS43905 represent DNA molecules encoding Neisserial proteins and peptide regions of proteins of the invention.

expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted adding a sultable hybrid partner and commercial manufacture is simplified only one expression and purification need to be employed in order to produce two separately-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for simultaneous heterologous

                                                                                                                                                                                        The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deletted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 953, 961 and 983. Sequences AAS43868-AAS43905 represent DNA molecules encoding Neisserial proteins and peptide regions of proteins of the invention.

                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for simultaneous heterologous expression of two or more Neisserial proteins which are in a fused state. The method is useful for simultaneous heterologous expression of two or more Neisserial proteins. A protein that may be unstable or poorly expressed on its own is assisted by adding a suitable hybrid partner and commercial manufacture is simplified-only one expression and purification need to be employed in order to produce two separately-

                                                                                                                                                                                                                     Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1;
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to methods for the heterologous expression of Neisserial proteins from Neisseria meningitidis and Neisseria gonorrhoeae. At least one domain in the protein is deletted, e.g. the leader peptide, and may be replaced by a domain from a different protein to make a fusion protein, in order to enhance heterologous expression of Neisserial proteins. Also, a region of a protein, such as a poly-glycine stretch, can be mutated to enhance expression. The proteins used in the processes include ORF46.1, 287, 741, 919, 933, 961 and 983. Sequences AAS43868-AAS43905 represent DNA molecules encoding Neisserial proteins
